

Robotics

What are robots?

Robots are machines that perform tasks without the help of humans. They have mechanical and electronic parts. We use computers to program them to perform tasks. Sometime robots mimick the human form, but most commonly they do not.

Robotics is the technology that deals with the design, construction and operation of robots.

Why we use robots:

Robots are used everywhere from work to home. These machines can do work too dangerous for humans, help around the house, or can be used just for fun.

Robot examples:

- Vacuum cleaners
- Toys
- Factory equipment
- Mars Rover
